Grafana Loki training

3 days (21 hours)

Presentation

Grafana Loki is a tool that provides you with a panel for indexing your systems' logs and viewing them on a dashboard. It doesn't index the content of the logs, but rather a set of labels for each log stream. This reduces the effort involved in processing and storing logs.

Grafana Loki is a multi-tenant log aggregation system inspired by Prometheus. Designed to be highly cost-effective and easy to operate, it is highly available and horizontally scalable. It is used primarily with tools such as Grafana, Prometheus and Cloud providers.

In this Grafana Loki training course, you'll learn how to collect and display logs with [Grafana Loki](#). We'll look in detail at the three components of Grafana Loki: Promtail, Loki and Grafana.

As always, our training is based on the latest versions of these tools, namely [Grafana 11](#) and [Loki 3.2](#).

Objectives

- Master the architecture and concepts of Grafana Loki
- Choosing the right indexing strategy for logs
- Configure Loki on a Kubernetes cluster using the official bar diagram

Target audience

- DevOps system administrators
- Developers
- Infrastructure architects

Prerequisites

- Basic knowledge of a Unix/Linux system
- Have already taken our [Prometheus & Grafana training course](#) or have a good command of the subject
- Experience Prometheus

Software requirements

- Recent version of Docker

Grafana Loki training program

Introduction to Prometheus and Loki

- Log centralization
- Introduction to Prometheus
- How Loki works
- Data access
- Data life cycle

Setting up Prometheus and Loki

- Installing Loki
- System integration
- Adding entry points

Discover the LogQL language

- Installing Prometheus
- PromQL language
- LogQL language

Setting up Grafana

- Introduction
- Data sources
- Dashboard creation
- TDB and the community
- TDB sharing
- Setting up extensions
- Dashboard as code

Setting up Nginx

- Installation
- Grafana, Loki and Prometheus exhibition
- Access protection
- Integration with Loki and Prometheus

Preparing and configuring applications

- Nginx output management
- Java Spring boot output management
- Label enrichment
- Metrics generation and injection in Prometheus

Alerts manager added

- Operating principle
- Email/slack notification configuration
- Inhibiting alerts

Docker and Kubernetes

- Deploying Loki in Docker
- Introduction to Kubernetes
- Principle of Loki integration
- Deployment in Kubernetes
- Creating a dashboard for the Nginx controller

Companies concerned

This course is aimed at both individuals and companies, large or small, wishing to train their teams in a new advanced computer technology, or to acquire specific business knowledge or modern methods.

Positioning on entry to training

Positioning at the start of training complies with Qualiopi quality criteria. As soon as registration is finalized, the learner receives a self-assessment questionnaire which enables us to assess his or her estimated level of proficiency in different types of technology, as well as his or her expectations and personal objectives for the training to come, within the limits imposed by the selected format. This questionnaire also enables us to anticipate any connection or security difficulties within the company (intra-company or virtual classroom) which could be problematic for the follow-up and smooth running of the training session.

Teaching methods

Practical training: 60% Practical, 40% Theory. Training material distributed in

to all participants.

Organization

The course alternates theoretical input from the trainer, supported by examples, with brainstorming sessions and group work.

Validation

At the end of the session, a multiple-choice questionnaire verifies the correct acquisition of skills.

Sanction

A certificate will be issued to each trainee who completes the course.
